WHEAT PERFORMANCE IN ILLINOIS TRIALS - 2022
Crop Sciences Special Report 2022-01, July 2022

Darin K. Joos and Jessica Rutkoski
Department of Crop Sciences, University of Illinois, Urbana

Overall the 2022 winter wheat growing season was good, but not excellent. At the beginning of May, the USDA projected average yield was 75 bushels per acre, just 4 bushels per acre lower than observed during the record-breaking 2021 season. Based on tiller counts from 63 fields across Southern IL done on May 24th, the Illinois Wheat Association (IWA) predicted that the average yield in Southern Illinois would be 69 bushels per acre. In many fields, stands were thinner than ideal. Later than optimal planting was likely to blame, as the weather during October 2021 was consistently rainy, making timely planting difficult. Once planted, high rainfall may have hindered establishment in some fields. While the actual average yield is still being determined, it seems that many growers were pleasantly surprised by the yield in spite of the circumstances.

Beyond yield, grain quality tended to be high. Dry conditions during grain filling and during harvest promoted high test weights and low vomitoxin levels. In fact, very little vomitoxin was detected this year. In part due to high wheat prices, most wheat growers applied a fungicide at flowering to control head scab. Without a doubt, this fungicide application played a role in keeping vomitoxin at bay.

It's worth mentioning that this season coincided with the Russian invasion of Ukraine. This war continues to affect US wheat growers and the public at large via its impact on the prices of fuel, fertilizer, and commodities. To promote increased crop production and mitigate rising food prices, just this July, the US Department of Agriculture expanded crop insurance for wheat-soybean double-cropping so that more counties are eligible. Additionally, the profitability of wheat-soybean double-cropping in 2023 is expected to be high in southern as well as in central Illinois given current commodity prices.

To aid variety selection decisions, we present these wheat variety testing results from 6 locations across the state of Illinois. Plots were seeded at the rate of 36 seeds per square foot, and consisted of six, 7.5-inch rows trimmed to about 16 feet before harvest. Yields were corrected to 13.5% moisture. Entries treated with seed-applied insecticide have insecticide treatment identified by the product trade name in the tables.

Location	Cooperator	Soil type	Planting		N	Harvest
			date	fertilizer		date
Elkville	Trent Funk	Hurst silt loam	Oct. 10	30 Fall	June 15	
				110 Spring		
Belleville	Dane Hunter	Ebbert silt loam	Oct. 5	30 Fall	June 18	
				85 Spring		
St Peter	Russ Schwarm	Hoyleton silt loam	Sept. 29	0 Fall	June 21	
				120 Spring		
Perry/Orr Center	Luke Merritt	Clarksdale silt loam	Oct. 8	30 Fall	June 28	
				80 Spring		
Urbana	Nick Eisenmenger	Flanagan silt loam	Oct. 1	30 Fall	June 29	
				40 Spring		
Hampshire	Dezeri DeRaedt	Drummer silt loam	Sept. 25	30 Fall	July 14	
				80 Spring		

Participating companies are listed on Page 2, regional data in Tables 1 and 2, individual location data in Tables 3 to 8, wheat variety characteristics in Table 9, and the Fusarium head scab ratings in Table 10.

Participating Companies

We thank these companies for their support of this program in 2022.

¹ST- Seed Treatment: C= Cruiser+Fungicide, F= Fungicide, G= Gaucho+Fungicide.² The Urbana location was not included due to poor data quality, possibly due to herbicide damage.³ On 7/5 strong winds and heavy rain caused many plots to lodge, since this happened so close to harvest I was able to pick up all the wheat and yield was not affected by lodging.

¹ST- Seed Treatment: C= Cruiser+Fungicide, F= Fungicide, G= Gaucho+Fungicide, E= Escalate+Fungicide.

2 Lodging score: 0= none, 9= all. Lodging was caused by freezing temperatures in spring during the tillering stage.

* Variety data dropped due to severe lodging and low yields in some early-greening varieties following low temperatures in March and early April.

Codes:

Type:

V = variety; B = blend; H = hybrid

Maturity:

E = 2 or more days earlier than average; ME = 1-2 days early; M = medium maturity, or about average of most varieties grown in Illinois; ML = 1-2 days later than M; L = 2 or more days later than M

Head type:

S = smooth (not bearded); T = tip-awned; B = awned (bearded)

Winterhardiness and standability are rated fair (F), good (G), very good (VG) or excellent (E)

Plant height: S = short; M = medium; T = tall

Hessian fly and disease reactions: S = susceptible; R = resistant; I = intermediate;

MS = moderately susceptible; MR = Moderately resistant

#.#- Varieties not entered in the region.

³Varieties were evaluated for resistance to soilborne mosaic virus (SBMV) at the SBUMV nursery at the University of Illinois South Farm at Urbana, IL. SBUMV and its vector are naturally present in the soil in this nursery. Disease symptoms were rated on a 1 to 9 scale in late March/ early April. Varieties with a score of 5 or below are considered to be resistant to SBUMV.³Varieties were evaluated for resistance to FHB at the University of Illinois South Farm at Urbana, IL. To promote disease symptoms, we spread scabby corn kernels on the soil surface 3 weeks before heading and mist irrigated three times per day for 15 minutes. Ratings for each variety are based on vomitoxin levels expected under FHB epidemic conditions. Ratings are expressed on a 0 to 9 scale with 0 being the best (lowest vomitoxin) and 9 being the worst (highest vomitoxin). Varieties with ratings lower than 3.4 are considered at least moderately resistant to FHB.
